In the framework of the FOZTUA vision project, several initiatives are being planned in order to disseminate the natural environment and history of Tua Valey and Tua Railway Line. One of the projects under development is OpenLab, a museological-like place where visitors will be able to witness important aspects of the Tua Valey region for memory’s sake.

This paper describes interactive experiments that are being designed for the OpenLab. These experiments will allow visitors to gain insight into several features of the Tua Railway Line, namely, locomotives and other rolling stock, buildings, track, track bed, switches, curves, tunnels, slopes, bridges, signs and signals.
